Name : Ailsa Rahma

NIM : 241331002

Class : 1A TTE

Activity 2: read the following passages and determine if the statements are true or false based on each passage.

The Chumash people lived in southwestern California, in areas that are now Los Angeles, Ventura, Santa Barbara, and San Luis Obispo counties. They also lived on the Channel Islands. Their land had many natural resources, which they used for daily life. They made tools and weapons from stone and built large, round houses using willow poles covered with woven mats. The Chumash were also skilled basket makers, creating beautiful designs with plant fibers. Wood from trees was used to make bowls, bows, and canoes. Some canoes were large and strong enough to carry up to twelve people and travel across the ocean.

The Chumash were skilled hunters and fishers. They hunted elk, antelope, deer, rabbits, and squirrels, but most of their food came from plants. They ate flowers, leaves, seeds, roots, and bulbs. Their main food was the acorn, which they ground into flour to make different dishes. They also used plants to make medicine.

Chumash villages were well-organized. Each village had houses, storage areas, a place for ceremonies, a field for games, a burial ground, and sweat lodges. The Chumash traded goods such as hides, food, baskets, tools, and canoes with other tribes. They even used small white shell beads as money. At their peak, the Chumash had 20,000 to 30,000 people living in 75 to 100 villages.

No.	***Statements***	***True***	***False***
1.	The Chumash people built houses using materials found in nature.	*T*	
2.	The Chumash mainly ate meat from the animals they hunted.		*F*
3.	The Chumash likely interacted with other tribes often.	*T*	
4.	The Chumash people probably had knowledge of the ocean and navigation.	*T*	
5.	The Chumash economy was advanced compared to many other early societies.	*T*	

As computers have become more powerful, computer graphics has grown into an important field. It is used in many areas, including business, industry, art, government, education, research, training, and medicine. Computer graphics helps create images quickly and at a lower cost. This technology makes it easier to design and visualize objects, making work more efficient in many fields.

One of the most important uses of computer graphics is in design, known as computer-aided design (CAD). CAD allows designers to see how an object will look before it is built. This helps them make changes quickly, unlike traditional hand-drawn designs. Engineers use CAD to create 3D images of machine parts, while automobile and aerospace designers rely on it to develop and test vehicles. Architects also use CAD to design buildings. They can create 3D models, explore room layouts, and even take virtual walks inside a building before it is built.

Another major use of computer graphics is in business. It helps create graphs, charts, and financial models to present data clearly. In education, it is used to make weather maps and other visual materials. Computer graphics is also important in advertising, publishing, and filmmaking, especially in animation, where images are created in sequence to bring movement to life.

No.	***Statements***	***True***	***False***
1.	Many jobs today use computer graphics.	*T*	
2.	Without computer graphics, it would take longer and cost more to create images.	*T*	
3.	Architects no longer need to create physical models of buildings.		*F*
4.	Businesses use computer graphics mainly for advertising.		*F*
5.	Computer graphics has made designing safer and more efficient.	*T*	

Jupiter is the largest planet in the solar system and the fifth planet from the sun. It is easy to observe for many months each year. On average, it is the brightest planet after Venus, though sometimes Mars can shine brighter for short periods. Jupiter has the shortest day of any major planet because it spins very fast, completing one full rotation in less than 10 hours. Unlike Earth, Jupiter does not have real seasons. This is because its axis is tilted by only about 3°, which is less than any other planet.

One of the most famous features of Jupiter is the Great Red Spot. This massive storm changes in color and brightness over time. Sometimes, it disappears for a few years but always returns. The Great Red Spot can grow as large as 40,000 kilometers long and 14,000 kilometers wide, which makes it bigger than Earth. While its position in latitude stays almost the same at -22°, it moves slightly in longitude. In the past, scientists thought it was a solid object floating in Jupiter's gas. However, space missions like Pioneer and Voyager showed that it is a weather system. The storm may be shrinking, and one day, it might disappear completely.

No.	***Statements***	***True***	***False***
1.	Jupiter is easier to see than most planets in the night sky.	*T*	
2.	A day on Jupiter is much shorter than a day on Earth.	*T*	
3.	Jupiter has extreme seasonal changes like Earth.		*F*
4.	The Great Red Spot is a permanent feature of Jupiter and will never disappear.		*F*
5.	Scientists once believed the Great Red Spot was a solid object.	*T*	

In North America, there are two types of bison: the plains bison and the woodland bison. The plains bison once lived across a large area, from Pennsylvania and Georgia to the Rocky Mountains. They were also found as far north as the Canadian forests and as far south as central Mexico. Bison are well adapted to cold weather. During blizzards, they lower their heads and face the storm directly. Even when snow covers the ground in winter, they can still find food. They use their strong heads and hooves to push away the snow and reach the grass underneath.

Bison are tough animals with very few natural enemies. However, humans nearly caused their extinction. By the year 1900, fewer than a thousand plains bison remained. Fortunately, efforts to protect them and increase their numbers have been successful. Today, bison herds live on both government and private lands, where they are safe. With proper care and planning, their population can continue to grow. Many other endangered animals also need similar protection to survive. By learning from the success of bison conservation, people can help save other species from disappearing forever.

No.	***Statements***	***True***	***False***
1.	Bison can survive in harsh winter conditions.	*T*	
2.	The plains bison only lived in the United States.		*F*
3.	If humans had not hunted bison, their population would not have dropped so much.	*T*	
4.	Without human intervention, the bison population would have continued to decline.	*T*	
5.	The conservation of bison suggests that other endangered animals can be saved with similar efforts.	*T*
